

AMH (Anti-Mullerian Hormone)

We are pleased to advise that **AMH (Anti-Mullerian Hormone)** is now available locally through Western Diagnostic Pathology, ensuring a faster result turn-around time and local support.

AMH is made by pre-antral and antral (early) follicles within the ovary.

AMH levels may be helpful in the following settings:

Assessment of Ovarian Reserve

Women concerned about fertility, women delaying child bearing and women with borderline FSH levels may gain further information from an AMH level. Importantly low AMH levels may precede a rise in FSH.

Polycystic Ovarian Syndrome

Women with PCOS have been reported to have increased levels of AMH reflecting the increased number of early follicles present. AMH is not affected by the stage of cycle and can be helpful in women with amenorrhoea or irregular periods.

Pre-Fertility treatment

AMH levels may be helpful in optimising fertility treatment regimes.

This test does not currently attract a Medicare rebate and patients will incur an ***out-of-pocket charge of \$50 for this test.***
